Columns by Ultimate Strength Design, Including Square Footings Concrete Reinforcing Steel Institute. Engineering Practice Committee 1967
Cyclic Behavior and Design of Steel Columns Subjected to Large Drift James David Newell 2008 During an earthquake, steel braced frame columns are potentially subjected to high axial forces combined with inelastic rotation demand resulting from lateral story drift. Little design guidance is available concerning the reliability of steel columns under this level of combined loading. To evaluate the performance of wide-flange columns under high axial load and drift demand, specimens have been subjected to laboratory and analytical investigation. Nine W14 wide-flange columns were tested at different levels of axial force demand (35% to 75% of column yield strength) combined with lateral story drift demand of up to 10%. Since a specified loading sequence does not exist in building codes, one was developed based on the results of nonlinear earthquake time-history analysis of 3-story and 7-story buckling-restrained braced frame models. The first step in the loading sequence consisted of imposing simulated gravity load. Then in-phase, increasing amplitude cyclic axial load and story drift were applied. Experimental results showed that flange local buckling was the dominant buckling mode. Specimens achieved interstory drift capacities of 0.07 rad. to 0.09 rad., in part, due to the delay in flange local buckling resulting from the stabilizing effect provided by the stocky column web of the W14 specimens. The finite element analysis program Abaqus was used to model the column specimens and to perform a parametric study investigating the effect of flange and web local buckling, lateral-torsional buckling, and axial load. Analysis and experimental results were observed to be well correlated. The behavior of deep columns (W18 and W24) with higher web slenderness than the tested W14 sections was also investigated. Models of deep column sections showed significant strength degradation due to the interaction of flange and web local buckling. Testing and finite element analysis indicated that the plastic rotation capacities currently predicted by Seismic Rehabilitation of Existing Buildings (ASCE 41) are very conservative for axial load ratios above 0.5. At axial load ratios below 0.5 the plastic rotation capacity of some finite element models was less than that predicted by ASCE 41. Using the database of finite element analysis results and regression analysis, nonlinear models were developed to more accurately predict rotation capacity of steel wide-flange columns. These models consider the interaction of flange and web local buckling, lateral-torsional buckling, and axial load.

The Column of Antoninus Pius Lise Vogel 1973 Shortly after the death in 161 of Antoninus Pius, his sons dedicated a column to him as a funerary monument. The form of the column in general and the reliefs on the pedestal in particular raise problems central to the understanding of Roman art. In this first thorough study, illustrated with nearly 100 photographs, Lise Vogel restores the column to its rightful place as one of the major monuments of Roman art. In addition, she re-evaluates the meaning of the column of Antoninus Pius in the context of the development of second century Roman imperial sculpture.

Concrete-Filled Stainless Steel Tubular Columns Vipulkumar Patel 2018-12-07 Concrete-filled stainless steel tubular (CFSST) columns are increasingly used in modern composite construction due to their high strength, high ductility, high corrosion resistance, high durability and aesthetics and ease of maintenance. Thin-walled CFSST columns are characterized by the different strain-hardening behavior of stainless steel in tension and in compression, local buckling of stainless steel tubes and concrete confinement. Design codes and numerical models often overestimate or underestimate the ultimate strengths of CFSST columns. This book presents accurate and efficient computational models for the nonlinear inelastic analysis and design of CFSST short and slender columns under axial load and biaxial bending. The effects of different strain-hardening characteristics of stainless steel in tension and in compression, progressive local and post-local buckling of stainless steel tubes and concrete confinement are taken into account in the computational models. The numerical models simulate the axial load-strain behavior, moment-curvature curves, axial load-deflection responses and axial load-moment strength interaction diagrams of CFSST columns. The book describes the mathematical formulations, computational procedures and model verifications for circular and rectangular CFSST short and slender columns. The behavior of CFSST columns under various loading conditions is demonstrated by numerous numerical examples. This book is written for practising structural and civil engineers, academic researchers and graduate students in civil engineering who are interested in the latest computational techniques and design methods for CFSST columns.

Told You So Ralph Nader 2013-05-28 "What sets Ralph Nader apart is that he has moved beyond social criticism to effective political action." —The New York Times The column is the most natural literary form for a citizen's advocate, and Ralph Nader may be its most robust and forceful practitioner. The Big Book of Ralph Nader Columns presents a panoramic portrait of the problems confronting our society and provides examples of the many actions an organized citizenry could and should take to create a more just and environmentally sustainable world. Drawing on decades of experience, Nader's columns document the consequences of concentrated corporate power; threats to our food, water and air; the corrosive effect of commercialism on our children; the dismantling of worker rights; and the attacks on our civil rights and civil liberties. Nader also offers concrete suggestions to spark citizen action and achieve social change.

Compressive Strength of Column Web Plates and Wide Web Columns (Classic Reprint) Robert S. Johnston 2017-10-28 Excerpt from Compressive Strength of Column Web Plates and Wide Web Columns The investigation reported in this paper was initiated by the Delaware River Bridge Joint Commission. Its purpose was three fold: (1) To study the relation between the thickness Of plate and unsupported widths Of plate for compression members with particular reference to the validity Of a commonly accepted structural designing rule as applied to high-strength steel; (2) to determine the ultimate strength Of laterally Supported Wide web column sections Of silicon manganese steel Of the type adopted by the commission for the towers Of the Delaware River Suspension Bridge with particular reference to the factors that determine the strength Of such columns; (3) to compare the action Of webs Of two thin plates stitch - riveted together, with a single thick plate web Of equal thickness. After consultation between the Bureau Of Standards and the Delaware River Bridge Joint Commission the dimensions Of the test specimens and the general test procedure were decided upon and the column sections ordered and forwarded to the bureau for test. The sections tested were full size tower section elements and represented the tower portions indicated in Figure 10. Column Generation Guy Desaulniers 2006-03-20 Column Generation is an insightful overview of the state of the art in integer programming column generation and its many applications. The volume begins with "A Primer in Column Generation" which outlines the theory and ideas necessary to solve large-scale practical problems, illustrated with a variety of examples. Other chapters follow this introduction on "Shortest Path Problems with Resource Constraints," "Vehicle Routing Problem with Time Window," "Branch-and-Price Heuristics," "Cutting Stock Problems," each dealing with methodological aspects of the field. Three chapters deal with transportation applications: "Large-scale Models in the Airline Industry," "Robust Inventory Ship Routing by Column Generation," and "Ship Scheduling with Recurring Visits and Visit Separation Requirements." Production is the focus of another three chapters: "Combining Column Generation and Lagrangian Relaxation," "Dantzig-Wolfe Decomposition for Job Shop Scheduling," and "Applying Column Generation to Machine Scheduling." The final chapter by François Vanderbeck, "Implementing Mixed Integer Column Generation," reviews how to set-up the Dantzig-Wolfe reformulation, adapt standard MIP techniques to the column generation context (branching, preprocessing, primal heuristics), and deal with specific column generation issues (initialization, stabilization, column management strategies).

Evaluation of Fiberglass Wrapped Concrete Bridge Columns Dante Fratta 2008 The main purpose of this project was to assess the effectiveness of fiberglass wrappings in reducing the corrosion degradation rate of concrete bridge columns. To evaluate the effectiveness of the technique, the research team used both nondestructive and destructive test methods. The results of the study show that the wrappings, while protecting the columns from further ingress of chloride ions, do not help deter corrosion activity when it is already present. Recommendations for the future use of fiber wraps, complemented with other remediation techniques and maintenance practices, are provided.

Fluid Dynamics of Packed Columns Jerzy Mackowiak 2009-12-10 The?rstGermanedition of thebook“Fluiddynamicsofpackedcolumns with modern random and structured packings for gas/liquid systems” was published in 1991. It sold out within a few years. Added to this were numerous enquiries, in particular within the industry, prompting me to publish a second, extended edition. A packed column remains the core element of any diffusional separation process. This underlines the need for basic design principles for packed columns, which enhance the design process by making it more accurate and reliable. The SBD (suspended bed of droplets) model introduced in the ?rst German edition of the book was well received by the experts and is now used by a large

number of com- nies in the industry, as it offers improved reliability in the ?uid dynamic design of packed columns. For the purpose of facilitating the design process, the SBD model was in- grated into the simulation programme ChemCAD. The software programme FDPAC, which is available for Windows, has certainly contributed to the widespread use of the SBD model. The programme is very user-friendly and the calculation results are p- sented in tabular as well as graphic form, showing ?ood load, pressure drop and hold-up diagrams in the entire operating range.

Tests of Large Columns with H-Shaped Sections (Classic Reprint) L. B. Tuckerman 2017-10-28 Excerpt from Tests of Large Columns With H-Shaped Sections The Bureau of Standards, in cooperation with the American Bridge co. Undertook, therefore, a study of a limited number (39) of larger columns, here called the first series, designedto compare the behaviors Of light and heavy columns of similar cross section. It was further desired to compare the strengths of riveted' columns fabricated in the ordinary manner Of plates and angles with similar solid rolled sections of the same section area, radius of gyration, length, and Of similar material As the previous tests had indicated that the properties of the steel influenced in a large degree the be havior of the columns, a series of 85 tensile test coupons were cut from the material of the columns and tested for yield point (by drop of beam), tensile strength and elongation, and) chemical analyses: were made from each coupon. Later 42 supplementary coupons were cut from some of the material and tested. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. The Fifth Column Andrew Gross 2019-09-10 “One of the best historical thriller authors in the business... [A] stellar novel.” —Associated Press #1 New York Times bestselling author of *The One Man* Andrew Gross once again delivers a tense, stirring thriller of a family torn apart set against the backdrop of a nation plunged into war. February, 1939. Europe teeters on the brink of war. In New York City, twenty-two thousand cheering Nazi supporters pack Madison Square Garden for a raucous, hate-filled rally. In a Hell’s Kitchen bar, Charles Mossman is reeling from the loss of his job and the demise of his marriage when a group draped in Nazi flags barges in. Drunk, Charlie takes a swing at one with tragic results and a torrent of unintended consequences follows. Two years later, America is wrestling with whether to enter the growing war. Charles’s estranged wife and six-year-old daughter, Emma, now live in a quiet brownstone in the German-speaking New York City neighborhood of Yorkville, where support for Hitler is common. Charles, just out of prison, struggles to put his life back together, while across the hall from his family, a kindly Swiss couple, Trudi and Willi Bauer, have taken a liking to Emma. But Charles begins to suspect that they might not be who they say they are. As the threat of war grows, and fears of a “fifth column”—German spies embedded into everyday life—are everywhere, Charles puts together that the seemingly amiable Bauers may be part of a sinister conspiracy. When Pearl Harbor is attacked and America can no longer sit on the sideline, that conspiracy turns into a deadly threat with Charles the only one who can see it and Emma, an innocent pawn.

Dynamic Stability of Columns under Nonconservative Forces Yoshihiko Sugiyama 2019-02-05 This book treats dynamic stability of structures under nonconservative forces. it is not a mathematics-based, but rather a dynamics-phenomena-oriented monograph, written with a full experimental background. Starting with fundamentals on stability of columns under nonconservative forces, it then deals with the divergence of Euler’s column under a dead (conservative) loading from a view point of dynamic stability. Three experiments with cantilevered columns under a rocket-based follower force are described to present the verifiability of nonconservative problems of structural stability. Dynamic stability of columns under pulsating forces is discussed through analog experiments, and by analytical and experimental procedures together with related theories. Throughout the volume the authors retain a good balance between theory and experiments on dynamic stability of columns under nonconservative loading, offering a new window to dynamic stability of structures, promoting student- and scientist-friendly experiments.

Tray Efficiencies in Distillation Columns American Institute of Chemical Engineers. Research Committee 1958

AIChE Equipment Testing Procedure - Trayed and Packed Columns American Institute of Chemical Engineers (AIChE) 2014-02-03 AIChE manual updates and consolidates procedures for testing performance of distillation columns From classic distillation operations to air stripping to other separations processes, selecting the correct column for appropriate efficient, safe, and environmentally-sound operations can be an important step. The newest updated volume in AIChE’s long-running Equipment Testing Procedures series, Trayed and Packed Columns: A Guide to Performance Evaluation, Third Edition provides chemical engineers, plant managers, and other professionals with helpful advice to assess and measure performance of a variety of distillation columns, including those that utilize bubble cap, sieve, valve trays, or packing material. The new book combines and updates into one user-friendly volume the best available field knowledge from previous publications on both types of distillation columns. Designed not as a single set of compulsory steps, but as a compilation of techniques, it will allow the user to select the procedure that best applies to its operating parameters. The testing steps presented can be used to assess reliable performance data on mass transfer efficiency, capacity, energy consumption, and pressure drop—information essential to effective troubleshooting of performance problems, identifying capacity bottlenecks, determining operating ranges, and a number of other routine maintenance and optimization processes. Opening with an extensive definition section, organized by topical area, the book then goes on to address: Selection of instrumentation and identification of elements to be measured Pre-test planning procedures Strategies for data collection and evaluation, including sampling procedures Pre-test, in-test, and post-test considerations (equipment, safety, process, environmental) Computation and interpretation of results, including individual breakdowns for trayed and packed columns in terms of hydraulic and efficiency performance Test troubleshooting analysis in twelve key areas The book concludes with appendices for relevant symbols and nomenclature, plus sample caculations generated from performance tests. With its engineer-tested procedures and thorough explanations, Trayed and Packed Columns: A Guide to Performance Evaluation, Third Edition is an essential text for anyone engaged in implementing new technology in equipment design, identifying process problems, and optimizing equipment performance.

Seismic Behavior of Deep, Slender Wide-Flange Structural Steel Beam-columns Piyachai Chansuk 2018 This thesis investigates nonlinear cyclic responses of deep wide-flange steel beam-columns, which are primarily used in Special Moment Frame (SMF) for their high in-plane, strong-axis moment of inertia to satisfy story drift limits specified in building codes. SMF design principles aim to achieve energy dissipation through plastic hinging of the beams, while flexural yielding of the columns at the base is also permitted. Although behavior of the beams has been extensively researched, that of the columns is lacking especially for deep columns (e.g., W18 to W36). Therefore, cyclic testing of deep columns was conducted to generate experimental database. Due to large width-to-thickness ratios of these sections, test results showed significant web and flange local buckling; some specimens also exhibited lateral-torsional buckling. These local and global instabilities resulted in significant axial shortening and flexural strength degradation. These behaviors differ significantly from those observed in prior testing of shallow W14 columns, featuring excellent ductility capacity at high axial loads. Additionally, the test matrix was designed to investigate the effects of section depths, varying axial loads, lateral-drift loading sequences, and boundary conditions on the column responses. Inevitably in this testing, the responses were also influenced by flexibility of column-end connections. To eliminate this undesired variable from the responses, a procedure was developed to correct the lateral drift response based on the second-order Timoshenko elastic theory. The effects of boundary conditions were further investigated using high-fidelity finite element software ABAQUS. Results show that fixed-fixed and fixed-rotating column responses can be converted to one another.

Geosynthetic Encased Columns for Soft Soil Improvement Márcio Almeida 2018-10-10 The geosynthetic encased column (GEC) is a relatively recent method developed for soft soil improvement. The method was firstly introduced as a concept in the 1980s and first practical applications started in the 1990s. GECs have been widely used in some parts of the world for the last three decades. However, there is no book in the literature summarizing the knowledge accumulated during this period in relation to this soft ground improvement technique. The purpose of this book is to provide readers with the GEC fundamentals and practical applications. Chapter 1 presents the general principles of this ground improvement technique including the methods used for GEC installation and how the material properties may be selected. Chapter 2 presents the design methods, thus settlement calculations by means of analytical methods and stability calculations by limit equilibrium methods are explained in detail. Chapter 3 presents calculation examples illustrating the usual steps to be done for both service limit state and ultimate limit state designs. Then field performances exemplifying practical applications of the GEC technique are presented in Chapter 4 for some case histories. Following numerical analyses, often used in design to complement analytical methods, are presented in Chapter 5. Annexes I and II at the end contain the charts developed to perform settlement calculations. The book combines the experiences of four authors with different academic and industry backgrounds to describe GEC design and performance. It is aimed at civil engineers in general, particularly geotechnical engineers, either working in design or in practice, at graduate students, and at senior undergraduate students.

Seismic Assessment and Retrofit of Reinforced Concrete Columns Konstantinos G. Megalooikonomou 2019-02-27 Reinforced concrete columns play a

very important role in structural performance. As such, it is essential to apply a suitable analytical tool to estimate their structural behaviour considering all failure mechanisms such as axial, shear, and flexural failures. This book highlights the development of a fiber beam-column element accounting for shear effects and the effect of tension stiffening through reinforcement-to-concrete bond, along with the employment of suitable constitutive material laws.
